

# Sand-Flee Drum Sander

What's a Sand-Flee? It's a wonderful new shop machine that'll save you time, improve the finished look of your woodworking projects and even make it easy to sand delicate scroll saw and fret work. Why hand-sand or suffer through the constant vibration of hand held sanders when you can just slide material across a table and have it sanded at the same time?

Unlike conventional drum sanders that put the drum over the work piece, the Sand-Flee Drum Sander has it built into a cabinet covered by a 1/4" casted & milled (Jig-Plate) aluminum which is buffed, polished, and sealed with a protective chromate conversion coating. This arrangement gives you direct control of the feed rate as you move the piece over the spinning drum. In addition you can now cover different sections of the drum with different grits of abrasive cloth or paper. Imagine progressing through different grits without having to recover the drum. It can't be any simpler or faster.

The hook and loop system of attaching abrasive material is quick and convenient. This approach also reduces heat buildup by creating a small cushion of air between the abrasive and the drum. By sanding at a lower temperature the abrasive has a significantly extended useful life.

Changing abrasive is also simple; lift up the hinged top, peel off the spiral wound strip and wind on a new one. No tools and no messy adhesives to deal with.

Another great feature is a takeoff shaft extending from the side of the cabinet. By adding the optional chuck you can start using very efficient sanding mops for irregular shaped moldings, bowls, carvings etc...

Sand-Flee Drum Sanders are available in 9" and 18" versions. Both feature a full length dust collection tray which can be emptied through a 2-1/2" vacuum hose fitting.

Add a Sand-Flee Drum Sander to your shop and see how much better sanding can be.
